Treatment of Tinnitus needs a combined neurootological and psychosomatic approach
Helmut Schaaf, Christiane Eichenberg, Kastellis, Gerhard Hesse

SUMMARY
In this study the results of the examination of 100 successive patients with Tinnitus, M. Meniere or vertigo, who were referred to a specialized neurootological and psychosomatic center, are presented. The study focuses on the results of the audiological tests and the question of the related hearing impairment as well as on psychological diagnosis and the possible connection between biographical details and symptom development.
Key words: Tinnitus, hearing loss, psychosomatic aspects
