The minimally invasive rhinoplasty with hyaluronic acid and botulinum toxin in a 49-year old woman

Marek Modrzyński, Andrzej Ignaciuk

SUMMARY
A significant component of human appearance and a major aspect of one's profile depend on the shape of the nose. This shape can be distorted by a variety of factors. To date, treatment options reported have included surgical procedures. Recently minimally invasive procedures for aesthetic medicine have become widely popular, and facial soft tissue augmentation is one of the most common procedures. This article presents a simple and effective alternative using hyaluronic acid and botulinum toxin in a 49-year old female patient in nasal recontouring. We think it is a very effective technique with immediate results. It can be employed in those cases where patients are reluctant to undergo a surgery, or as a primary indication of the correction of minor nose defects.
