SUMMARY
The rare case of 75-years-old female patient was presented in this paper. She reported hoarsness in addition to pharyngeal pain, dysphagia and medium level dyspnea. Her exploration revealed a wide hematoma of the left lateral wall of orohypopharynx spreading to the left aryepiglottic fold, left aryepiglottic cartilage, false and true vocal fold and later to left lateral and posterior tracheal wall. The patient did not require a control of airway by intubation or tracheotomy according to quick relief after farmacological treatment.
